(2) The forces due to air pressure differences caused when two trains pass at the minimum separation for two adjacent tracks, while traveling in opposite directions, each train traveling at the maximum authorized speed.

§238.223 Locomotive fuel tanks.

- (a) External fuel tanks. External locomotive fuel tanks shall comply with the requirements contained in Appendix D to this part, or an industry standard providing at least an equivalent level of safety if approved by FRA under §238.21.
 - (b) Internal fuel tanks.
- (1) Internal locomotive fuel tanks shall be positioned in a manner to reduce the likelihood of accidental penetration from roadway debris or collision.
- (2) Internal fuel tank vent systems shall be designed so they do not become a path of fuel loss in any tank orientation due to a locomotive overturning.
- (3) Internal fuel tank bulkheads and skin shall at a minimum be equivalent to a %-inch thick steel plate with a 25,000 pounds-per-square-inch yield strength. Material of a higher yield strength may be used to decrease the required thickness of the material provided at least an equivalent level of strength is maintained. Skid plates are not required.

§238.225 Electrical system.

All passenger equipment shall comply with the following:

- (a) Conductors. Conductor sizes shall be selected on the basis of current-carrying capacity, mechanical strength, temperature, flexibility requirements, and maximum allowable voltage drop. Current-carrying capacity shall be derated for grouping and for operating temperature.
 - (b) Main battery system.
- (1) The main battery compartment shall be isolated from the cab and passenger seating areas by a non-combustible barrier.
- (2) Battery chargers shall be designed to protect against overcharging.
- (3) If batteries are of the type to potentially vent explosive gases, the battery compartment shall be adequately ventilated to prevent the accumulation

- of explosive concentrations of these gases.
 - (c) Power dissipation resistors.
- (1) Power dissipating resistors shall be adequately ventilated to prevent overheating under worst-case operating conditions as determined by the railroad.
- (2) Power dissipation grids shall be designed and installed with sufficient isolation to prevent combustion.
- (3) Resistor elements shall be electrically insulated from resistor frames, and the frames shall be electrically insulated from the supports that hold them.
- (d) Electromagnetic interference and compatibility.
- (1) The operating railroad shall ensure electromagnetic compatibility of the safety-critical equipment systems with their environment. Electromagnetic compatibility may be achieved through equipment design or changes to the operating environment.
- (2) The electronic equipment shall not produce electrical noise that affects the safe performance of train line control and communications or way-side signaling systems.
- (3) To contain electromagnetic interference emissions, suppression of transients shall be at the source wherever possible.
- (4) All electronic equipment shall be self-protected from damage or improper operation, or both, due to high voltage transients and long-term overvoltage or under-voltage conditions. This includes protection from both power frequency and harmonic effects as well as protection from radio frequency signals into the microwave frequency range.

§238.227 Suspension system.

On or after November 8, 1999-

(a) All passenger equipment shall exhibit freedom from hunting oscillations at all operating speeds. If hunting oscillations do occur, a railroad shall immediately take appropriate action to prevent derailment. For purposes of this paragraph, hunting oscillations shall be considered lateral oscillations of trucks that could lead to a dangerous instability.

§ 238.229

- (b) All passenger equipment intended for service above 110 mph shall demonstrate stable operation during prerevenue service qualification tests at all operating speeds up to 5 mph in excess of the maximum intended operating speed under worst-case conditions—including component wear—as determined by the operating railroad.
- (c) Nothing in this section shall affect the requirements of part 213 of this chapter as they apply to passenger equipment as provided in that part.

§238.229 Safety appliances.

Except as provided in this part, all passenger equipment continues to be subject to the safety appliance requirements contained in Federal statute at 49 U.S.C. chapter 203 and in Federal regulations at part 231 and §232.2 of this chapter.

§238.231 Brake system.

Except as otherwise provided in this section, on or after September 9, 1999 the following requirements apply to all passenger equipment and passenger trains.

- (a) A passenger train's primary brake system shall be capable of stopping the train with a service application from its maximum authorized operating speed within the signal spacing existing on the track over which the train is operating.
- (b) The brake system design of passenger equipment ordered on or after September 8, 2000 or placed in service for the first time on or after September 9, 2002, shall not require an inspector to place himself or herself on, under, or between components of the equipment to observe brake actuation or release.
- (c) Passenger equipment shall be provided with an emergency brake application feature that produces an irretrievable stop, using a brake rate consistent with prevailing adhesion, passenger safety, and brake system thermal capacity. An emergency brake application shall be available at any time, and shall be initiated by an unintentional parting of the train.
- (d) A passenger train brake system shall respond as intended to signals from a train brake control line or lines. Control lines shall be designed so that failure or breakage of a control line

will cause the brakes to apply or will result in a default to control lines that meet this requirement.

- (e) Introduction of alcohol or other chemicals into the air brake system of passenger equipment is prohibited.
- (f) The operating railroad shall require that the design and operation of the brake system results in wheels that are free of condemnable cracks.
- (g) Disc brakes shall be designed and operated to produce a surface temperature no greater than the safe operating temperature recommended by the disc manufacturer and verified by testing or previous service.
 - (h) Hand brakes and parking brakes.
- (1) Except for a locomotive that is ordered before September 8, 2000 or placed in service for the first time before Sepbember 9, 2002, and except for MU locomotives, all locomotives shall be equipped with a hand or parking brake that can:
 - (i) Be applied or activated by hand;
 - (ii) Be released by hand; and
- (iii) Hold the loaded unit on the maximum grade anticipated by the operating railroad.
- (2) Except for a private car and locomotives addressed in paragraph (h)(1) of this section, all other passenger equipment, including MU locomotives, shall be equipped with a hand brake that meets the requirements for hand brakes contained in part 231 of this chapter and that can:
 - (i) Be applied or activated by hand;
- (ii) Be released by hand; and
- (iii) Hold the loaded unit on the maximum grade anticipated by the operating railroad.
- (i) Passenger cars shall be equipped with a means to apply the emergency brake that is accessible to passengers and located in the vestibule or passenger compartment. The emergency brake shall be clearly identified and marked.
- (j) Locomotives equipped with blended brakes shall be designed so that:
- (1) The blending of friction and dynamic brake to obtain the correct retarding force is automatic;
- (2) Loss of power or failure of the dynamic brake does not result in exceeding the allowable stopping distance;
